

GGER 142 PROJECT

NUMBERS GAME

Instructor name: Ms. Fredrieke Jungtow

Course name: German II

Course number: GGER 142

Section: 1

Done by: Deema Hamidah/ S20106517

Shumokh Abdullah/ S21107192

Our German 2 course project aimed to help German 1 students practice the memorization of numbers in a fun and engaging way. As we all know, learning a new language can be challenging, and often requires repetitive practice to master certain concepts. To make this process more enjoyable, we decided to create a puzzle game using HTML, JS, and CSS.

We chose this idea because we wanted to address a common challenge that many beginner-level German learners face, which is memorizing numbers in the German language. German numbers are not necessarily complex, but they are pronounced differently from English numbers, which can be confusing and require practice to master. Numbers are necessary for many everyday situations, such as telling time, giving directions, or making purchases. We thought that creating a game that allows students to practice numbers in a fun and interactive way would be a great way to help them master this aspect of the language. By incorporating a competition aspect, we hoped to make the game even more engaging and motivating for students.

Deema and I worked together to make the project both interesting and informative. The game is designed for two groups, each with a chart of numbers placed randomly. The first group will pick a number, and the second group will search for it. While the second group searches, the first group can solve the puzzle game we made on a website. The group that finishes the puzzle first wins. We believe that this game will not only help students practice their German language skills but also foster teamwork and healthy competition among the players.

Deema took the lead in designing the puzzle game's user interface and layout. She spent days researching and experimenting with different HTML, CSS, and JS codes to ensure that the game would look and function smoothly. In addition to that, she designed the game's competition aspect, which added an exciting element to the game.

As for myself, I spent a lot of time debugging the code and testing the game to make sure that everything worked as it should. Additionally, I created the game's hangman feature as an extra activity to provide even more practice for students. Overall, our collaborative effort resulted in a game that is both entertaining and educational for students of the German language.

During our German presentation about numbers, we faced some challenges. One significant challenge was that we were unable to finish the numbers game within the allotted time because students were not fast in choosing a number. This was a valuable lesson for us, highlighting the importance of setting a timer to ensure that tasks are completed within specified timeframes. Despite this challenge, the students responded positively to our presentation. They found it both educational and enjoyable.

Overall, we thoroughly enjoyed working on this game project and presenting it to German 1 class. It was a rewarding experience for us, as we not only had the opportunity to enhance our own German language skills but also gained valuable skills in areas such as teamwork, problem-solving, and effective communication. This project not only deepened our understanding of German numbers but also made us even more passionate about learning the language.
